## 1 Introduction

This document provides a description of the SDRplay Software Defined Radio API. This API provides a common interface to the RSP1, RSP2, RSP2pro, RSP1A and RSPduo from SDRplay Limited which make use of the Mirics USB bridge device (MSi2500) and the multi-standard tuner (MSi001).

From version 3.0 the API will be delivered as a service on Windows and as a daemon on non-Windows based systems. The service/daemon manages the control and data flow from each device to the end application.

The basic method of operation is in 3 main stages...

1. Set the API parameters based on the selected device
2. Initialise the device to start the stream
3. Change variables and perform an update to the API

This process can be seen in the example code in section 4.

The first function call must be to `sdrplay_api_Open()` and the last must be to `sdrplay_api_Close()` otherwise the service can be left in an unknown state.

In the header file descriptions in section 2, you will find the parameters that need to be set depending on the type of device. All parameters have a default setting.

The RSPduo can operate in single tuner mode (just like an RSP2), in dual tuner mode (both streams in a single instance) or in master/slave mode. If the RSPduo is already in use in master mode, then accessing the device again will mean that only slave mode is available. In master/slave mode, parameters that affect both tuners are only allowed to be set by the master.

Pages 4 and 5 of the RSPduo introduction document (<https://www.sdrplay.com/wp-content/uploads/2018/05/RSPduo-Introduction-V3.pdf>) present more information about valid states and supported sample rates for dual tuner operation.

The structures are defined in a hierarchy. For example, to enable the Bias-T on RSP1A, use...

```
deviceParams->rxChannelA->rsp1aTunerParams.biasTEnable = 1;
```

If this was before an initialisation, then there would be nothing else to do. To enable the Bias-T during stream, then after setting the variable, a call to the update function is required...

```
sdrplay_api_Update(chosenDevice->dev, chosenDevice->tuner,  
                  sdrplay_api_Update_Rsp1a_BiasTControl);
```

## 2 API Data Types

The header files providing the definitions of the external data types and functions provided by this API are:

```
sdrplay_api.h  
sdrplay_api_rx_channel.h  
sdrplay_api_dev.h  
sdrplay_api_tuner.h  
sdrplay_api_control.h  
sdrplay_api_rsp1a.h  
sdrplay_api_rsp2.h  
sdrplay_api_rspDuo.h  
sdrplay_api_callback.h
```

### 2.1 sdrplay\_api.h

The top-level header file to be included in all applications making use of the sdrplay\_api API. Defines the available functions and the structures used by them - further detail of sub-structures is contained in the subsequent sections describing the contents of each header file.

#### 2.1.1 API Functions

```
sdrplay_api_ErrT sdrplay_api_Open(void);  
sdrplay_api_ErrT sdrplay_api_Close(void);  
sdrplay_api_ErrT sdrplay_api_ApiVersion(float *apiVer);  
sdrplay_api_ErrT sdrplay_api_LockDeviceApi(void);  
sdrplay_api_ErrT sdrplay_api_UnlockDeviceApi(void);  
sdrplay_api_ErrT sdrplay_api_GetDevices(sdrplay_api_DeviceT *devices,  
                                         unsigned int *numDevs,  
                                         unsigned int maxDevs);  
sdrplay_api_ErrT sdrplay_api_SelectDevice(sdrplay_api_DeviceT *device);  
sdrplay_api_ErrT sdrplay_api_ReleaseDevice(sdrplay_api_DeviceT *device);  
const char* sdrplay_api_GetErrorString(sdrplay_api_ErrT err);  
sdrplay_api_ErrT sdrplay_api_DebugEnable(HANDLE dev,  
                                         unsigned int enable);  
sdrplay_api_ErrT sdrplay_api_GetDeviceParams(HANDLE dev,  
                                             sdrplay_api_DeviceParamsT **deviceParams);  
sdrplay_api_ErrT sdrplay_api_Init(HANDLE dev,  
                                   sdrplay_api_CallbackFnsT *callbackFns,  
                                   void *cbContext);  
sdrplay_api_ErrT sdrplay_api_Uninit(HANDLE dev);  
sdrplay_api_ErrT sdrplay_api_Update(HANDLE dev,  
                                    sdrplay_api_TunerSelectT tuner,  
                                    sdrplay_api_ReasonForUpdateT reasonForUpdate);  
sdrplay_api_ErrT sdrplay_api_SwapRspDuoActiveTuner(HANDLE dev,  
                                                    sdrplay_api_TunerSelectT *currentTuner,  
                                                    sdrplay_api_RspDuo_AmPortSelectT tuner1AmPortSel);  
sdrplay_api_ErrT sdrplay_api_SwapRspDuoDualTunerModeSampleRate(HANDLE dev,  
                                                                double *currentSampleRate);
```

## 2.1.2 API Function Prototypes

```
typedef sdrplay_api_ErrT (*sdrplay_api_Open_t)(void);
typedef sdrplay_api_ErrT (*sdrplay_api_Close_t)(void);
typedef sdrplay_api_ErrT (*sdrplay_api_ApiVersion_t)(float *apiVer);
typedef sdrplay_api_ErrT (*sdrplay_api_LockDeviceApi_t)(void);
typedef sdrplay_api_ErrT (*sdrplay_api_UnlockDeviceApi_t)(void);
typedef sdrplay_api_ErrT (*sdrplay_api_GetDevices_t)(sdrplay_api_DeviceT *devices,
                                                    unsigned int *numDevs,
                                                    unsigned int maxDevs);
typedef sdrplay_api_ErrT (*sdrplay_api_SelectDevice_t)(sdrplay_api_DeviceT *device);
typedef sdrplay_api_ErrT (*sdrplay_api_ReleaseDevice_t)(sdrplay_api_DeviceT *device);
typedef const char* (*sdrplay_api_GetErrorString_t)(sdrplay_api_ErrT err);
typedef sdrplay_api_ErrT (*sdrplay_api_DebugEnable_t)(HANDLE dev,
                                                    unsigned int enable);
typedef sdrplay_api_ErrT (*sdrplay_api_GetDeviceParams_t)(HANDLE dev,
                                                         sdrplay_api_DeviceParamsT **deviceParams);
typedef sdrplay_api_ErrT (*sdrplay_api_Init_t)(HANDLE dev,
                                               sdrplay_api_CallbackFnsT *callbackFns,
                                               void *cbContext);
typedef sdrplay_api_ErrT (*sdrplay_api_Uninit_t)(HANDLE dev);
typedef sdrplay_api_ErrT (*sdrplay_api_Update_t)(HANDLE dev,
                                                sdrplay_api_TunerSelectT tuner,
                                                sdrplay_api_ReasonForUpdateT reasonForUpdate);
typedef sdrplay_api_ErrT (*sdrplay_api_SwapRspDuoActiveTuner_t)(HANDLE dev,
                                                              sdrplay_api_TunerSelectT *tuner,
                                                              sdrplay_api_RspDuo_AmPortSelectT tuner1AmPortSel);
typedef sdrplay_api_ErrT (*sdrplay_api_SwapRspDuoDualTunerModeSampleRate_t)(
    double *currentSampleRate);
```

## 2.1.3 Constant Definitions

```
#define SDRPLAY_MAX_DEVICES          (16)    // Maximum devices supported by the API
#define SDRPLAY_MAX_TUNERS_PER_DEVICE (2)    // Maximum number of tuners available on one device

#define SDRPLAY_MAX_SER_NO_LEN      (64)    // Maximum length of device serial numbers
#define SDRPLAY_MAX_ROOT_NM_LEN     (128)   // Maximum length of device names

// Supported device IDs
#define SDRPLAY_RSP1_ID              (1)
#define SDRPLAY_RSP1A_ID             (255)
#define SDRPLAY_RSP2_ID              (2)
#define SDRPLAY_RSPduo_ID            (3)
```

## 2.1.4 Enumerated Data Types

Error Code Enumerated Type:

```
typedef enum
{
    sdrplay_api_Success              = 0,
    sdrplay_api_Fail                 = 1,
    sdrplay_api_InvalidParam         = 2,
    sdrplay_api_OutOfRange           = 3,
    sdrplay_api_GainUpdateError      = 4,
    sdrplay_api_RfUpdateError        = 5,
    sdrplay_api_FsUpdateError        = 6,
    sdrplay_api_HwError              = 7,
    sdrplay_api_AliasingError        = 8,
    sdrplay_api_AlreadyInitialised   = 9,
    sdrplay_api_NotInitialised       = 10,
    sdrplay_api_NotEnabled           = 11,
    sdrplay_api_HwVerError           = 12,
    sdrplay_api_OutOfMemError        = 13,
    sdrplay_api_ServiceNotResponding = 14,
    sdrplay_api_StartPending         = 15,
    sdrplay_api_StopPending          = 16
} sdrplay_api_ErrT;
```

# Software Defined Radio API

## Update Enumerated Type:

```
typedef enum
{
    sdrplay_api_Update_None = 0x00000000,

    // Reasons for master only mode
    sdrplay_api_Update_Dev_Fs = 0x00000001,
    sdrplay_api_Update_Dev_Ppm = 0x00000002,
    sdrplay_api_Update_Dev_SyncUpdate = 0x00000004,
    sdrplay_api_Update_Dev_ResetFlags = 0x00000008,

    sdrplay_api_Update_Rspla_RfNotchControl = 0x00000010,
    sdrplay_api_Update_Rspla_RfDabNotchControl = 0x00000020,

    sdrplay_api_Update_Rsp2_ExtRefControl = 0x00000040,

    sdrplay_api_Update_RspDuo_ExtRefControl = 0x00000080,

    sdrplay_api_Update_Master_Spare_1 = 0x00000100,
    sdrplay_api_Update_Master_Spare_2 = 0x00000200,

    // Reasons for master and slave mode
    sdrplay_api_Update_Tuner_Gr = 0x00000400,
    sdrplay_api_Update_Tuner_GrLimits = 0x00000800,
    sdrplay_api_Update_Tuner_Frf = 0x00001000,
    sdrplay_api_Update_Tuner_BwType = 0x00002000,
    sdrplay_api_Update_Tuner_Iftype = 0x00004000,
    sdrplay_api_Update_Tuner_DcOffset = 0x00008000,
    sdrplay_api_Update_Tuner_LoMode = 0x00010000,

    sdrplay_api_Update_Ctrl_DCOffsetIQimbalance = 0x00020000,
    sdrplay_api_Update_Ctrl_Decimation = 0x00040000,
    sdrplay_api_Update_Ctrl_Agc = 0x00080000,
    sdrplay_api_Update_Ctrl_AdsbMode = 0x00100000,
    sdrplay_api_Update_Ctrl_OverloadMsgAck = 0x00200000,

    sdrplay_api_Update_Rspla_BiasTControl = 0x00400000,

} sdrplay_api_ReasonForUpdateT;
```

## 2.1.5 Data Structures

Device enumeration structure:

```
typedef struct
{
    char SerNo[SDRPLAY_MAX_SER_NO_LEN]; // Set by the API on return from
                                        // sdrplay_api_GetDevices() contains the serial
                                        // number of the device
    unsigned char hwVer; // Set by the API on return from
                        // sdrplay_api_GetDevices() contains the Hardware
                        // version of the device
    unsigned char heartBeatDisabled; // Set by the application and used during
                                    // sdrplay_api_SelectDevice() to disable the
                                    // heartBeat thread (which monitors the device to
                                    // ensure it continues to operate)
    sdrplay_api_TunerSelectT tuner; // Set by the API on return from
                                   // sdrplay_api_GetDevices() indicating which tuners
                                   // are available.
                                   // Set by the application and used during
                                   // sdrplay_api_SelectDevice() to indicate which
                                   // tuner(s) is to be used.
    sdrplay_api_RspDuoModeT rspDuoMode; // Set by the API on return from
                                        // sdrplay_api_GetDevices() for RSPduo devices
                                        // indicating which modes are available.
                                        // Set by the application and used during
                                        // sdrplay_api_SelectDevice() for RSPduo device to
                                        // indicate which mode is to be used.
    double rspDuoSampleFreq; // Set by the API on return from
                             // sdrplay_api_GetDevices() for RSPduo slaves
                             // indicating the sample rate previously set by the
                             // master.
                             // Set by the application and used during
                             // sdrplay_api_SelectDevice() by RSPduo masters to
                             // indicate required sample rate.
    HANDLE dev; // Set by the API on return from
               // sdrplay_api_SelectDevice() for use in subsequent
               // calls to the API. Do not alter!
} sdrplay_api_DeviceT;
```

Device Parameters Structure:

```
typedef struct
{
    sdrplay_api_DevParamsT *devParams; // All parameters for a single device (except tuner
                                        // parameters)
    sdrplay_api_RxChannelParamsT *rxChannelA; // First tuner parameters for all devices
    sdrplay_api_RxChannelParamsT *rxChannelB; // Second tuner parameters for RSPduo
} sdrplay_api_DeviceParamsT;
```

## 2.2 sdrplay\_api\_rx\_channel.h

### 2.2.1 Data Structures

Receive Channel Structure:

```
typedef struct
{
    sdrplay_api_TunerParamsT tunerParams;
    sdrplay_api_ControlParamsT ctrlParams;
    sdrplay_api_Rsp1aTunerParamsT rsp1aTunerParams;
    sdrplay_api_Rsp2TunerParamsT rsp2TunerParams;
    sdrplay_api_RspDuoTunerParamsT rspDuoTunerParams;
} sdrplay_api_RxChannelParamsT;
```

## 2.3 sdrplay\_api\_dev.h

Provides definitions of non-tuner related parameters

### 2.3.1 Enumerated Data Types

Transfer Mode Enumerated Type:

```
typedef enum
{
    sdrplay_api_ISOCH = 0,
    sdrplay_api_BULK  = 1
} sdrplay_api_TransferModeT;
```

### 2.3.2 Data Structures

Default values for each parameter are given - for sub-structures, the default values will be given in the structure definition for that type.

ADC Sampling Frequency Parameters Structure:

```
typedef struct
{
    double fsHz;                // default: 2000000.0
    unsigned char syncUpdate;   // default: 0
    unsigned char reCal;        // default: 0
} sdrplay_api_FsFreqT;
```

Synchronous Update Parameters Structure:

```
typedef struct
{
    unsigned int sampleNum;     // default: 0
    unsigned int period;        // default: 0
} sdrplay_api_SyncUpdateT;
```

Reset Update Operations Structure:

```
typedef struct
{
    unsigned char resetGainUpdate; // default: 0
    unsigned char resetRfUpdate;   // default: 0
    unsigned char resetFsUpdate;   // default: 0
} sdrplay_api_ResetFlagsT;
```

Non-Receive Channel Related Device Parameters:

```
typedef struct
{
    double                ppm;                // default: 0.0
    sdrplay_api_FsFreqT  fsFreq;
    sdrplay_api_SyncUpdateT syncUpdate;
    sdrplay_api_ResetFlagsT resetFlags;
    sdrplay_api_TransferModeT mode;          // default: sdrplay_api_ISOCH
    unsigned int          samplesPerPkt;     // default: 0 (output param)
    sdrplay_api_RsplaParamsT rsplaParams;
    sdrplay_api_Rsp2ParamsT rsp2Params;
    sdrplay_api_RspDuoParamsT rspDuoParams;
} sdrplay_api_DevParamsT;
```

## 2.4 sdrplay\_api\_tuner.h

### 2.4.1 Constant Definitions

```
#define MAX_BB_GR (59) // Maximum baseband gain reduction
```

### 2.4.2 Enumerated Data Types

#### Bandwidth Enumerated Type:

```
typedef enum
{
    sdrplay_api_BW_Undefined = 0,
    sdrplay_api_BW_0_200     = 200,
    sdrplay_api_BW_0_300     = 300,
    sdrplay_api_BW_0_600     = 600,
    sdrplay_api_BW_1_536     = 1536,
    sdrplay_api_BW_5_000     = 5000,
    sdrplay_api_BW_6_000     = 6000,
    sdrplay_api_BW_7_000     = 7000,
    sdrplay_api_BW_8_000     = 8000
} sdrplay_api_Bw_MHzT;
```

#### IF Enumerated Type:

```
typedef enum
{
    sdrplay_api_IF_Undefined = -1,
    sdrplay_api_IF_Zero      = 0,
    sdrplay_api_IF_0_450     = 450,
    sdrplay_api_IF_1_620     = 1620,
    sdrplay_api_IF_2_048     = 2048
} sdrplay_api_If_kHzT;
```

#### LO Enumerated Type:

```
typedef enum
{
    sdrplay_api_LO_Undefined = 0,
    sdrplay_api_LO_Auto      = 1,
    sdrplay_api_LO_120MHz    = 2,
    sdrplay_api_LO_144MHz    = 3,
    sdrplay_api_LO_168MHz    = 4
} sdrplay_api_LoModeT;
```

#### Minimum Gain Enumerated Type:

```
typedef enum
{
    sdrplay_api_EXTENDED_MIN_GR = 0,
    sdrplay_api_NORMAL_MIN_GR   = 20
} sdrplay_api_MinGainReductionT;
```

#### Tuner Selected Enumerated Type:

```
typedef enum
{
    sdrplay_api_Tuner_Neither = 0,
    sdrplay_api_Tuner_A       = 1,
    sdrplay_api_Tuner_B       = 2,
    sdrplay_api_Tuner_Both    = 3,
} sdrplay_api_TunerSelectT;
```

## 2.4.3 Data Structures

### Current Gain Value Structure:

```
typedef struct
{
    float curr;
    float max;
    float min;
} sdrplay_api_GainValuesT;
```

### Gain Setting Parameter Structure:

```
typedef struct
{
    int gRdB; // default: 50
    unsigned char LNASTate; // default: 0
    unsigned char syncUpdate; // default: 0
    sdrplay_api_MinGainReductionT minGr; // default: sdrplay_api_NORMAL_MIN_GR
    sdrplay_api_GainValuesT gainVals; // output parameter
} sdrplay_api_GainT;
```

### RF Frequency Parameter Structure:

```
typedef struct
{
    double rfHz; // default: 200000000.0
    unsigned char syncUpdate; // default: 0
} sdrplay_api_RfFreqT;
```

### DC Calibration Paramter Structure:

```
typedef struct
{
    unsigned char dcCal; // default: 3 (Periodic mode)
    unsigned char speedUp; // default: 0 (No speedup)
    int trackTime; // default: 1 (=> time in uSec = (dcCal * 3 *
trackTime) = 9uSec)
    int refreshRateTime; // default: 2048 (=> time in uSec = (dcCal * 3 *
refreshRateTime) = 18432uSec)
} sdrplay_api_DcOffsetTunerT;
```

### Tuner Parameter Structure:

```
typedef struct
{
    sdrplay_api_Bw_MHzT bwType; // default: sdrplay_api_BW_0_200
    sdrplay_api_If_kHzT ifType; // default: sdrplay_api_IF_Zero (master) or
// sdrplay_api_IF_0_450 (slave)
    sdrplay_api_LoModeT loMode; // default: sdrplay_api_LO_Auto
    sdrplay_api_GainT gain;
    sdrplay_api_RfFreqT rfFreq;
    sdrplay_api_DcOffsetTunerT dcOffsetTuner;
} sdrplay_api_TunerParamsT;
```

## 2.5 sdrplay\_api\_control.h

### 2.5.1 Enumerated Data Types

AGC Loop Bandwidth Enumerated Type:

```
typedef enum
{
    sdrplay_api_AGC_DISABLE = 0,
    sdrplay_api_AGC_100HZ   = 1,
    sdrplay_api_AGC_50HZ   = 2,
    sdrplay_api_AGC_5HZ    = 3
} sdrplay_api_AgcControlT;
```

ADS-B Configuration Enumerated Type:

```
typedef enum
{
    sdrplay_api_ADSB_DECIMATION           = 0,
    sdrplay_api_ADSB_NO_DECIMATION_LOWPASS = 1,
    sdrplay_api_ADSB_NO_DECIMATION_BANDPASS_2MHZ = 2,
    sdrplay_api_ADSB_NO_DECIMATION_BANDPASS_3MHZ = 3
} sdrplay_api_AdsbModeT;
```

### 2.5.2 Data Structures

DC Offset Control Parameters Structure:

```
typedef struct
{
    unsigned char DCenable;           // default: 1
    unsigned char IQenable;          // default: 1
} sdrplay_api_DcOffsetT;
```

Decimation Control Parameters Structure:

```
typedef struct
{
    unsigned char enable;             // default: 0
    unsigned char decimationFactor;   // default: 1
    unsigned char wideBandSignal;     // default: 0
} sdrplay_api_DecimationT;
```

AGC Control Parameters Structure:

```
typedef struct
{
    sdrplay_api_AgcControlT enable;   // default: sdrplay_api_AGC_50HZ
    int setPoint_dBfs;                // default: -60
    int knee_dBfs;                    // default: 0
    unsigned char decay_ms;           // default: 0
    unsigned char hang_ms;            // default: 0
    int syncUpdate;                   // default: 0
    unsigned char LNastate;           // default: 0
} sdrplay_api_AgcT;
```

Control Parameters Structure:

```
typedef struct
{
    sdrplay_api_DcOffsetT dcOffset;
    sdrplay_api_DecimationT decimation;
    sdrplay_api_AgcT agc;
    sdrplay_api_AdsbModeT adsbMode;   //default: sdrplay_api_ADSB_DECIMATION
} sdrplay_api_ControlParamsT;
```

## 2.6 sdrplay\_api\_rsp1a.h

### 2.6.1 Constant Definitions

```
#define RSPIA_NUM_LNA_STATES          10    // Number of LNA states in all bands (except where
defined differently below)
#define RSPIA_NUM_LNA_STATES_AM      7     // Number of LNA states in AM band
#define RSPIA_NUM_LNA_STATES_LBAND   9     // Number of LNA states in L band
```

### Data Structures

#### RSP1A RF Notch Control Parameters Structure:

```
typedef struct
{
    unsigned char rfNotchEnable;          // default: 0
    unsigned char rfDabNotchEnable;      // default: 0
} sdrplay_api_RsplaParamsT;
```

#### RSP1A Bias-T Control Parameters Structure:

```
typedef struct
{
    unsigned char biasTEnable;           // default: 0
} sdrplay_api_RsplaTunerParamsT;
```

## 2.7 sdrplay\_api\_rsp2.h

### 2.7.1 Constant Definitions

```
#define RSPII_NUM_LNA_STATES          9    // Number of LNA states in in all bands (except
where defined differently below)
#define RSPII_NUM_LNA_STATES_AMPOR  5    // Number of LNA states for HiZ port
#define RSPII_NUM_LNA_STATES_420MHZ 6    // Number of LNA states in 420MHz band
```

### 2.7.2 Enumerated Data Types

RSP2 Antenna Selection Enumerated Type:

```
typedef enum
{
    sdrplay_api_Rsp2_ANTENNA_A = 5,
    sdrplay_api_Rsp2_ANTENNA_B = 6,
} sdrplay_api_Rsp2_AntennaSelectT;
```

RSP2 AM Port Enumerated Type:

```
typedef enum
{
    sdrplay_api_Rsp2_AMPOR_1 = 1,
    sdrplay_api_Rsp2_AMPOR_2 = 0,
} sdrplay_api_Rsp2_AmPortSelectT;
```

### 2.7.3 Data Structures

RSP2 External Reference Control Parameters Structure:

```
typedef struct
{
    unsigned char extRefOutputEn;           // default: 0
} sdrplay_api_Rsp2ParamsT;
```

RSP2 Tuner Parameters Structure:

```
typedef struct
{
    unsigned char          biasTEnable;     // default: 0
    sdrplay_api_Rsp2_AmPortSelectT amPortSel; // default: sdrplay_api_Rsp2_AMPOR_2
    sdrplay_api_Rsp2_AntennaSelectT antennaSel; // default: sdrplay_api_Rsp2_ANTENNA_A
    unsigned char          rfNotchEnable;   // default: 0
} sdrplay_api_Rsp2TunerParamsT;
```

## 2.8 sdrplay\_api\_rspDuo.h

### 2.8.1 Constant Definitions

```
#define RSPDUO_NUM_LNA_STATES          10 // Number of LNA states in all bands (except where
defined differently below)
#define RSPDUO_NUM_LNA_STATES_AMPORT  5 // Number of LNA states for HiZ port
#define RSPDUO_NUM_LNA_STATES_AM      7 // Number of LNA states in AM band
#define RSPDUO_NUM_LNA_STATES_LBAND   9 // Number of LNA states in L band
```

### 2.8.2 Enumerated Data Types

RSPduo Operating Mode Enumerated Type:

```
typedef enum
{
    sdrplay_api_RspDuoMode_Unknown      = 0,
    sdrplay_api_RspDuoMode_Single_Tuner = 1,
    sdrplay_api_RspDuoMode_Dual_Tuner   = 2,
    sdrplay_api_RspDuoMode_Master       = 4,
    sdrplay_api_RspDuoMode_Slave        = 8,
} sdrplay_api_RspDuoModeT;
```

RSPduo AM Port Enumerated Type:

```
typedef enum
{
    sdrplay_api_RspDuo_AMPOR_1 = 1,
    sdrplay_api_RspDuo_AMPOR_2 = 0,
} sdrplay_api_RspDuo_AmPortSelectT;
```

### 2.8.3 Data Structures

RSPduo External Reference Control Parameters Structure:

```
typedef struct
{
    int extRefOutputEn; // default: 0
} sdrplay_api_RspDuoParamsT;
```

RSPduo Tuner Parameters Structure:

```
typedef struct
{
    unsigned char biasTEnable; // default: 0
    sdrplay_api_RspDuo_AmPortSelectT tuner1AmPortSel; // default: sdrplay_api_RspDuo_AMPOR_2
    unsigned char tuner1AmNotchEnable; // default: 0
    unsigned char rfNotchEnable; // default: 0
    unsigned char rfDabNotchEnable; // default: 0
} sdrplay_api_RspDuoTunerParamsT;
```

## 2.9 sdrplay\_api\_callback.h

### 2.9.1 Enumerated Data Types

Power Overload Event Enumerated Type:

```
typedef enum
{
    sdrplay_api_Overload_Detected      = 0,
    sdrplay_api_Overload_Corrected     = 1,
} sdrplay_api_PowerOverloadCbEventIdT;
```

RSPduo Event Enumerated Type:

```
typedef enum
{
    sdrplay_api_MasterInitialised      = 0,
    sdrplay_api_SlaveAttached          = 1,
    sdrplay_api_SlaveDetached         = 2,
    sdrplay_api_SlaveInitialised      = 3,
    sdrplay_api_SlaveUninitialised    = 4,
} sdrplay_api_RspDuoModeCbEventIdT;
```

Events Enumerated Type:

```
typedef enum
{
    sdrplay_api_GainChange              = 0,
    sdrplay_api_PowerOverloadChange     = 1,
    sdrplay_api_DeviceRemoved          = 2,
    sdrplay_api_RspDuoModeChange       = 3,
} sdrplay_api_EventT;
```

## 2.9.2 Data Structures

### Gain Change Callback Structure:

```
typedef struct
{
    unsigned int gRdB;
    unsigned int lnaGRdB;
    double      currGain;
} sdrplay_api_GainCbParamT;
```

### Power Overload Callback Structure:

```
typedef struct
{
    sdrplay_api_PowerOverloadCbEventIdT powerOverloadChangeType;
} sdrplay_api_PowerOverloadCbParamT;
```

### RSPduo Callback Structure:

```
typedef struct
{
    sdrplay_api_RspDuoModeCbEventIdT modeChangeType;
} sdrplay_api_RspDuoModeCbParamT;
```

### Combination of Event Callback Structures:

```
typedef union
{
    sdrplay_api_GainCbParamT      gainParams;
    sdrplay_api_PowerOverloadCbParamT powerOverloadParams;
    sdrplay_api_RspDuoModeCbParamT rspDuoModeParams;
} sdrplay_api_EventParamsT;
```

### Streaming Data Parameter Callback Structure:

```
typedef struct
{
    unsigned int firstSampleNum;
    int         grChanged;
    int         rfChanged;
    int         fsChanged;
    unsigned int numSamples;
} sdrplay_api_StreamCbParamsT;
```

### Callback Function Definition Structure:

```
typedef struct
{
    sdrplay_api_StreamCallback_t StreamACbFn;
    sdrplay_api_StreamCallback_t StreamBCbFn;
    sdrplay_api_EventCallback_t  EventCbFn;
} sdrplay_api_CallbackFnsT;
```

## 2.9.3 Callback Function Prototypes

```
typedef void (*sdrplay_api_StreamCallback_t)(short *xi,
                                             short *xq,
                                             sdrplay_api_StreamCbParamsT *params,
                                             unsigned int numSamples,
                                             unsigned int reset,
                                             void *cbContext);

typedef void (*sdrplay_api_EventCallback_t)(sdrplay_api_EventT eventId,
                                             sdrplay_api_TunerSelectT tuner,
                                             sdrplay_api_EventParamsT *params,
                                             void *cbContext);
```

## 3 Function Descriptions

### 3.1 sdrplay\_api\_Open

`sdrplay_api_ErrT sdrplay_api_Open(void)`

#### Description:

Opens the API and configures the API for use. This function must be called before any other API function.

#### Parameters:

`void` No parameters

#### Return:

`sdrplay_api_ErrT` Error code as defined below:

<code>sdrplay_api_Success</code>	API successfully opened
<code>sdrplay_api_Fail</code>	API failed to open

### 3.2 sdrplay\_api\_Close

`sdrplay_api_ErrT sdrplay_api_Close(void)`

#### Description:

Tidies up and closes the API. After calling this function it is no longer possible to access other API functions until `sdrplay_api_Open()` is successfully called again.

#### Parameters:

`void` No parameters

#### Return:

`sdrplay_api_ErrT` Error code as defined below:

<code>sdrplay_api_Success</code>	API successfully closed
----------------------------------	-------------------------

### 3.3 sdrplay\_api\_ApiVersion

`sdrplay_api_ErrT sdrplay_api_ApiVersion(float *apiVer)`

#### Description:

This function checks that the version of the include file used to compile the application is consistent with the API version being used.

#### Parameters:

`apiVer` Pointer to a float which returns the version of the API

#### Return:

`sdrplay_api_ErrT` Error code as defined below:

<code>sdrplay_api_Success</code>	Successful completion
<code>sdrplay_api_Fail</code>	Command failed
<code>sdrplay_api_InvalidParam</code>	NULL pointer
<code>sdrplay_api_ServiceNotResponding</code>	Communication channel with service broken

## 3.4 sdrplay\_api\_LockDeviceApi

sdrplay\_api\_ErrT sdrplay\_api\_LockDeviceApi(void)

### Description:

Attempts to lock the API for exclusive use of the current application. Once locked, no other applications will be able to use the API. Typically used to lock the API prior to calling sdrplay\_api\_GetDevices() to ensure only one application can select a given device. After completing device selection using sdrplay\_api\_SelectDevice(), sdrplay\_api\_UnlockDeviceApi() can be used to release the API. May also be used prior to calling sdrplay\_api\_ReleaseDevice() if it is necessary to reselect the same device.

### Parameters:

void                      No parameters

### Return:

sdrplay\_api\_ErrT      Error code as defined below:

sdrplay_api_Success	Successful completion
sdrplay_api_Fail	Command failed
sdrplay_api_ServiceNotResponding	Communication channel with service broken

## 3.5 sdrplay\_api\_UnlockDeviceApi

sdrplay\_api\_ErrT sdrplay\_api\_UnlockDeviceApi(void)

### Description:

See description for sdrplay\_api\_LockDeviceApi().

### Parameters:

none                      No parameters

### Return:

sdrplay\_api\_ErrT      Error code as defined below:

sdrplay_api_Success	Successful completion
sdrplay_api_Fail	Command failed
sdrplay_api_ServiceNotResponding	Communication channel with service broken

## 3.6 sdrplay\_api\_GetDevices

```
sdrplay_api_ErrT sdrplay_api_GetDevices(sdrplay_api_DeviceT *devices,  
                                       unsigned int *numDevs,  
                                       unsigned int maxDevs)
```

### Description:

This function returns a list of all available devices (upto a maximum defined by maxDev parameter). Once the list has been retrieved, a device can be selected based on the required characteristics.

### Parameters:

devices	Pointer to an array of device enumeration structures used to return the list of available devices
numDevs	Pointer to a variable which on return will indicate the the number of available devices
maxDevs	Specifies the maximum number of devices that can be returned in the list (size of array of device enumeration structures)

### Return:

sdrplay_api_ErrT	Error code as defined below:	
	sdrplay_api_Success	Successful completion
	sdrplay_api_Fail	Command failed
	sdrplay_api_InvalidParam	NULL pointer
	sdrplay_api_ServiceNotResponding	Communication channel with service broken

## 3.7 sdrplay\_api\_SelectDevice

```
sdrplay_api_ErrT sdrplay_api_SelectDevice(sdrplay_api_DeviceT *device)
```

### Description:

Once a device is selected from the list of devices returned in sdrplay\_api\_GetDevices(), and the additional information for the device configured (see the definitions of sdrplay\_api\_DeviceT for more information), this function will select the device. Once a device has been selected, it is no longer available for other applications (unless the device is a RSPduo in master/slave mode). On return from this call, the sdrplay\_api\_DeviceT structure passed in contains a handle that can be used in subsequent calls to the API.

### Parameters:

device	Pointer to the sdrplay_api_DeviceT structure for the selected device
--------	--

### Return:

sdrplay_api_ErrT	Error code as defined below:	
	sdrplay_api_Success	Successful completion
	sdrplay_api_Fail	Command failed
	sdrplay_api_InvalidParam	NULL pointer
	sdrplay_api_ServiceNotResponding	Communication channel with service broken

## 3.8 sdrplay\_api\_ReleaseDevice

```
sdrplay_api_ErrT sdrplay_api_ReleaseDevice(sdrplay_api_DeviceT *device)
```

### Description:

Releases a device and makes that device available for other applications.

### Parameters:

device                      Pointer to the sdrplay\_api\_DeviceT structure for the device to be released

### Return:

sdrplay_api_ErrT	Error code as defined below:	
	sdrplay_api_Success	Successful completion
	sdrplay_api_Fail	Command failed
	sdrplay_api_InvalidParam	NULL pointer
	sdrplay_api_ServiceNotResponding	Communication channel with service broken

## 3.9 sdrplay\_api\_GetErrorString

```
const char* sdrplay_api_GetErrorString(sdrplay_api_ErrT err)
```

### Description:

Upon receipt of an error code, a print friendly error string can be obtained using the function. The returned pointer is a pointer to a static array and does not need to be free'd.

### Parameters:

err                          Error code to be converted to a string.

### Return:

const char \*                Pointer to a string containing the error definition

## 3.10 sdrplay\_api\_DebugEnable

```
sdrplay_api_ErrT sdrplay_api_DebugEnable(HANDLE dev,  
                                         unsigned int enable)
```

### Description:

Enable or disable debug output logging. This logging can help with debugging issues, but will increase the processing load and in some extreme cases, may cause data dropout.

### Parameters:

dev	Handle of selected device from current device enumeration structure (can be NULL for reduced logging prior to selecting a device)
enable	:0 turn off debug logging :1 turn on debug logging

### Return:

sdrplay_api_ErrT	Error code as defined below:	
	sdrplay_api_Success	Successful completion
	sdrplay_api_ServiceNotResponding	Communication channel with service broken

## 3.11 sdrplay\_api\_GetDeviceParams

```
sdrplay_api_ErrT sdrplay_api_GetDeviceParams(HANDLE dev,  
                                             sdrplay_api_DeviceParamsT **deviceParams)
```

### Description:

Devices are configured via the parameters contained in the device parameter structure. After selecting a device, the default device parameters are returned and can be modified as required before `sdrplay_api_Init()` is called. After `sdrplay_api_Init()` has been called, any changes made to the device parameters must be signalled to the API using `sdrplay_api_Update()` before they will be applied.

### Parameters:

<code>dev</code>	Handle of selected device from current device enumeration structure
<code>deviceParams</code>	Pointer to a pointer to the device parameters used to setup/control the device

### Return:

<code>sdrplay_api_ErrT</code>	Error code as defined below:	
	<code>sdrplay_api_Success</code>	Successful completion
	<code>sdrplay_api_Fail</code>	Command failed
	<code>sdrplay_api_NotInitialised</code>	Device has not been selected
	<code>sdrplay_api_ServiceNotResponding</code>	Communication channel with service broken

## 3.12 sdrplay\_api\_Init

```
sdrplay_api_ErrT sdrplay_api_Init(HANDLE dev,  
                                sdrplay_api_CallbackFnsT *callbackFns,  
                                void *cbContext)
```

### Description:

This function will initialise the tuners according to the device parameter structure. After successfully completing initialisation it will set up a thread inside the API which will perform the processing chain. This thread will use the callback function to return the data to the calling application.

Processing chain (in order):

ReadUSBdata	fetch packets of IQ samples from USB interface
DCoffsetCorrection	enabled by default
Agc	enabled by default
DownConvert	enabled in LIF mode when parameters are consistent with down-conversion to baseband
Decimate	disabled by default
IQimbalanceCorrection	enabled by default

Conditions for LIF down-conversion to be enabled for RSP1, RSP1a, RSP2a and RSPduo in single tuner mode:

```
(fsHz == 8192000) && (bwType == sdrplay_api_BW_1_536) && (ifType == sdrplay_api_IF_2_048)  
(fsHz == 8000000) && (bwType == sdrplay_api_BW_1_536) && (ifType == sdrplay_api_IF_2_048)  
(fsHz == 8000000) && (bwType == sdrplay_api_BW_5_000) && (ifType == sdrplay_api_IF_2_048)  
(fsHz == 2000000) && (bwType <= sdrplay_api_BW_0_300) && (ifType == sdrplay_api_IF_0_450)  
(fsHz == 2000000) && (bwType == sdrplay_api_BW_0_600) && (ifType == sdrplay_api_IF_0_450)  
(fsHz == 6000000) && (bwType <= sdrplay_api_BW_1_536) && (ifType == sdrplay_api_IF_1_620)
```

In RSPduo master/slave mode, down-conversion is always enabled.

In RSPduo master/slave mode, the slave application cannot be initialised until the master application is running. In this case, a call to `sdrplay_api_Init()` will return `sdrplay_api_StartPending` without starting and the call must be repeated after a `sdrplay_api_RspDuoModeChange->sdrplay_api_MasterInitialised` event has been received.

### Parameters:

<code>dev</code>	Handle of selected device from current device enumeration structure
<code>callbackFns</code>	Pointer to a structure specifying the callback functions to use to send processed data and events
<code>cbContext</code>	Pointer to a context passed to the API that will be returned as a parameter in the callback functions

### Return:

<code>sdrplay_api_ErrT</code>	Error code as defined below:	
	<code>sdrplay_api_Success</code>	Successful completion
	<code>sdrplay_api_Fail</code>	Command failed
	<code>sdrplay_api_NotInitialised</code>	Device has not been selected
	<code>sdrplay_api_InvalidParam</code>	NULL pointer
	<code>sdrplay_api_AlreadyInitialised</code>	There has been a previous call to this function
	<code>sdrplay_api_OutOfRange</code>	One or more parameters are set incorrectly
	<code>sdrplay_api_HwError</code>	HW error occurred during tuner initialisation
	<code>sdrplay_api_RfUpdateError</code>	Failed to update Rf frequency
	<code>sdrplay_api_StartPending</code>	Master device not running
	<code>sdrplay_api_ServiceNotResponding</code>	Communication channel with service broken

## 3.13 sdrplay\_api\_Uninit

`sdrplay_api_ErrT sdrplay_api_Uninit(HANDLE dev)`

### Description:

Stops the stream and uninitialises the tuners. In RSPduo master/slave mode, the master application cannot be uninitialised until the slave application is stopped. In this case, a call to `sdrplay_api_Uninit()` will return `sdrplay_api_StopPending` without making any changes and the call must be repeated after a `sdrplay_api_RspDuoModeChange->sdrplay_api_SlaveUninitialised` event has been received.

### Parameters:

`dev` Handle of selected device from current device enumeration structure

### Return:

<code>sdrplay_api_ErrT</code>	<b>Error code as defined below:</b>	
	<code>sdrplay_api_Success</code>	Successful completion
	<code>sdrplay_api_Fail</code>	Command failed
	<code>sdrplay_api_NotInitialised</code>	Device has not been selected
	<code>sdrplay_api_StopPending</code>	Slave device running
	<code>sdrplay_api_ServiceNotResponding</code>	Communication channel with service broken

## 3.14 sdrplay\_api\_Update

```
sdrplay_api_ErrT sdrplay_api_Update(HANDLE dev,
                                   sdrplay_api_TunerSelectT tuner,
                                   sdrplay_api_ReasonForUpdateT reasonForUpdate)
```

### Description:

This function is used to indicate that parameters have been changed and need to be applied. Used to change any combination of values of the parameters. If required it will stop the stream, change the values and then start the stream again, otherwise it will make the changes directly.

The parameters associated with each update type are specified below:

```
sdrplay_api_Update_Dev_Fs           : deviceParams->devParams->fsFreq->*
sdrplay_api_Update_Dev_Ppm         : deviceParams->devParams->ppm
sdrplay_api_Update_Dev_SyncUpdate  : deviceParams->devParams->syncUpdate->*
sdrplay_api_Update_Dev_ResetFlags  : deviceParams->devParams->resetFlags->*
sdrplay_api_Update_Rspla_RfNotchControl :
    deviceParams->devParams->rsplaParams->rfNotchEnable
sdrplay_api_Update_Rspla_RfDabNotchControl :
    deviceParams->devParams->rsplaParams->rfDabNotchEnable
sdrplay_api_Update_Rsp2_ExtRefControl :
    deviceParams->devParams->rsp2Params->extRefOutputEn
sdrplay_api_Update_RspDuo_ExtRefControl :
    deviceParams->devParams->rspDuoParams->extRefOutputEn
sdrplay_api_Update_Tuner_Gr         :
    deviceParams->rxChannel*->tunerParams->gain->gRdB_or
    deviceParams->rxChannel*->tunerParams->gain->LNAtate
sdrplay_api_Update_Tuner_GrLimits   :
    deviceParams->rxChannel*->tunerParams->gain->minGr
sdrplay_api_Update_Tuner_Frf        : deviceParams->rxChannel*->tunerParams->rfFreq->*
sdrplay_api_Update_Tuner_BwType     : deviceParams->rxChannel*->tunerParams->bwType
sdrplay_api_Update_Tuner_Iftype     : deviceParams->rxChannel*->tunerParams->ifType
sdrplay_api_Update_Tuner_DcOffset   : deviceParams->rxChannel*->tunerParams->loMode
sdrplay_api_Update_Tuner_LoMode     :
    deviceParams->rxChannel*->tunerParams->dcOffsetTuner->*
sdrplay_api_Update_Ctrl_DCoffsetIQimbalance : deviceParams->rxChannel*->ctrlParams->dcOffset->*
sdrplay_api_Update_Ctrl_Decimation  :
    deviceParams->rxChannel*->ctrlParams->decimation->*
sdrplay_api_Update_Ctrl_Agc         : deviceParams->rxChannel*->ctrlParams->agc->*
sdrplay_api_Update_Ctrl_AdsbMode    : deviceParams->rxChannel*->ctrlParams->adsbMode
sdrplay_api_Update_Ctrl_OverloadMsgAck : none (used whenever a power overload event occurs
    as an acknowledge signal)
sdrplay_api_Update_Rspla_BiasTControl :
    deviceParams->rxChannel*->rsplaTunerParams->biasTEnable
sdrplay_api_Update_Rsp2_BiasTControl :
    deviceParams->rxChannel*->rsp2TunerParams->biasTEnable
sdrplay_api_Update_Rsp2_AmPortSelect :
    deviceParams->rxChannel*->rsp2TunerParams->amPortSel
sdrplay_api_Update_Rsp2_AntennaControl :
    deviceParams->rxChannel*->rsp2TunerParams->antennaSel
sdrplay_api_Update_Rsp2_RfNotchControl :
    deviceParams->rxChannel*->rsp2TunerParams->rfNotchEnable
sdrplay_api_Update_RspDuo_BiasTControl :
    deviceParams->rxChannel*->rspDuoTunerParams->biasTEnable
sdrplay_api_Update_RspDuo_AmPortSelect :
    deviceParams->rxChannel*->rspDuoTunerParams->tuner1AmPortSel
sdrplay_api_Update_RspDuo_Tuner1AmNotchControl :
    deviceParams->rxChannel*->rspDuoTunerParams->tuner1AmNotchEnable
sdrplay_api_Update_RspDuo_RfNotchControl :
    deviceParams->rxChannel*->rspDuoTunerParams->rfNotchEnable
sdrplay_api_Update_RspDuo_RfDabNotchControl :
    deviceParams->rxChannel*->rspDuoTunerParams->rfDabNotchEnable
```

### Parameters:

dev	Handle of selected device from current device enumeration structure
tuner	Specifies which tuner(s) to apply the update to
reasonForUpdate	Specifies the reason for the call depending on which parameters have been changed

## Return:

<code>sdrplay_api_ErrT</code>	<b>Error code as defined below:</b>	
<code>sdrplay_api_Success</code>		Successful completion
<code>sdrplay_api_Fail</code>		Command failed
<code>sdrplay_api_InvalidParam</code>		NULL pointer or invalid operating mode
<code>sdrplay_api_OutOfRange</code>		One or more parameters are set incorrectly
<code>sdrplay_api_HwError</code>		HW error occurred during tuner initialisation
<code>sdrplay_api_FsUpdateError</code>		Failed to update sample rate
<code>sdrplay_api_RfUpdateError</code>		Failed to update Rf frequency
<code>sdrplay_api_GainUpdateError</code>		Failed to update gain
<code>sdrplay_api_NotEnabled</code>		Feature not enabled
<code>sdrplay_api_ServiceNotResponding</code>		Communication channel with service broken

## 3.15 sdrplay\_api\_SwapRspDuoActiveTuner

```
sdrplay_api_ErrT sdrplay_api_SwapRspDuoActiveTuner(HANDLE dev,  
                                                  sdrplay_api_TunerSelectT *currentTuner,  
                                                  sdrplay_api_RspDuo_AmPortSelectT tuner1AmPortSel)
```

### Description:

After a call to `sdrplay_api_Init()` for an RSPduo in single tuner mode, this function can be called to change between tuners while maintaining the exact same settings (except in the case when switching from TunerB to TunerA when HiZ is selected by the `tuner1AmPortSel` parameter). After successful completion, the current device enumeration structure will be updated with the newly selected tuner.

### Parameters:

<code>dev</code>	Handle of selected device from current device enumeration structure
<code>currentTuner</code>	Pointer to the selected tuner stored in the current device enumeration structure
<code>tuner1AmPortSel</code>	Specifies whether to use the HiZ port when switching to TunerA when the AM band is selected

### Return:

<code>sdrplay_api_ErrT</code>	Error code as defined below:	
	<code>sdrplay_api_Success</code>	Successful completion
	<code>sdrplay_api_Fail</code>	Command failed
	<code>sdrplay_api_InvalidParam</code>	NULL pointer or invalid operating mode
	<code>sdrplay_api_OutOfRange</code>	One or more parameters are set incorrectly
	<code>sdrplay_api_HwError</code>	HW error occurred during tuner initialisation
	<code>sdrplay_api_RfUpdateError</code>	Failed to update Rf frequency
	<code>sdrplay_api_ServiceNotResponding</code>	Communication channel with service broken

## 3.16 sdrplay\_api\_SwapRspDuoDualTunerModeSampleRate

```
sdrplay_api_ErrT sdrplay_api_SwapRspDuoDualTunerModeSampleRate(HANDLE dev,  
                                                                double *currentSampleRate)
```

### Description:

After a call to `sdrplay_api_Init()` for an RSPduo in master/slave mode, this function can be called to change sample rates between 6MHz and 8MHz. After successful completion, the current device enumeration structure will be updated with the newly selected sample rate. This function can only be called by the master application. As this affects the slave application as well, if it is currently active, the call will return `sdrplay_api_StopPending` without making any changes and the call must be repeated after a `sdrplay_api_RspDuoModeChange->sdrplay_api_SlaveUninitialised` event has been received.

### Parameters:

<code>dev</code>	Handle of selected device from current device enumeration structure
<code>currentSampleRate</code>	Pointer to the selected sample rate stored in the current device enumeration structure

### Return:

<code>sdrplay_api_ErrT</code>	Error code as defined below:	
	<code>sdrplay_api_Success</code>	Successful completion
	<code>sdrplay_api_Fail</code>	Command failed
	<code>sdrplay_api_InvalidParam</code>	NULL pointer or invalid operating mode
	<code>sdrplay_api_OutOfRange</code>	One or more parameters are set incorrectly
	<code>sdrplay_api_HwError</code>	HW error occurred during tuner initialisation
	<code>sdrplay_api_RfUpdateError</code>	Failed to update Rf frequency
	<code>sdrplay_api_StopPending</code>	Slave device running
	<code>sdrplay_api_ServiceNotResponding</code>	Communication channel with service broken

## 3.17 Streaming Data Callback

```
typedef void (*sdrplay_api_StreamCallback_t) (short *xi,  
                                             short *xq,  
                                             sdrplay_api_StreamCbParamsT *params,  
                                             unsigned int numSamples,  
                                             unsigned int reset,  
                                             void *cbContext)
```

### Description:

This callback is triggered when there are samples to be processed.

### Parameters:

<code>xi</code>	Pointer to the real data in the buffer
<code>xq</code>	Pointer to the imaginary data in the buffer
<code>params</code>	Pointer to the stream callback parameters structure
<code>numSamples</code>	The number of samples in the current buffer
<code>reset</code>	Indicates if a re-initialisation has occurred within the API and that local buffering should be reset
<code>cbContext</code>	Pointer to context passed into <code>sdrplay_api_Init()</code>

### Return:

none

## 3.18 Event Callback

```
typedef void (*sdrplay_api_EventCallback_t) (sdrplay_api_EventT eventId,  
                                             sdrplay_api_TunerSelectT tuner,  
                                             sdrplay_api_EventParamsT *params,  
                                             void *cbContext)
```

### Description:

This callback is triggered whenever an event occurs. The list of events is specified by the `sdrplay_api_EventT` enumerated type.

### Parameters:

<code>eventId</code>	Indicates the type of event that has occurred
<code>tuner</code>	Indicates which tuner(s) the event relates to
<code>params</code>	Pointer to the event callback union (the structure used depends on the <code>eventId</code> )
<code>cbContext</code>	Pointer to context passed into <code>sdrplay_api_Init()</code>

### Return:

none

## 4 API Usage

```
// sdrplay_api_sample_app.c : Simple console application showing the use of the API

#include <Windows.h>
#include <stdio.h>
#include <conio.h>

#include "sdrplay_api.h"

int masterInitialised = 0;
int slaveUninitialised = 0;

## 5 Gain Reduction Tables

LNA GR (dB) by Band and LNAstate for RSP1:

Frequency (MHz)	LNAstate			
	0	1	2	3
0-420	0	24	19 <sup>1</sup>	43 <sup>2</sup>
420-1000	0	7	19 <sup>1</sup>	26 <sup>2</sup>
1000-2000	0	5	19 <sup>1</sup>	24 <sup>2</sup>

LNA GR (dB) by Band and LNAstate for RSP1A:

Frequency (MHz)	LNAstate									
	0	1	2	3	4	5	6	7	8	9
0-60	0	6	12	18	37	42	61 <sup>2</sup>			
60-420	0	6	12	18	20	26	32	38	57	62
420-1000	0	7	13	19	20	27	33	39	45	64 <sup>2</sup>
1000-2000	0	6	12	20	26	32	38	43	62 <sup>2</sup>	

LNA GR (dB) by Band and LNAstate for RSP2:

Frequency (MHz)	LNAstate									
	0	1	2	3	4	5	6	7	8	
0-420 (Port A or B)	0	10	15	21	24	34	39	45	64 <sup>2</sup>	
420-1000	0	7	10	17	22	41 <sup>2</sup>				
1000-2000	0	5	21	15 <sup>3</sup>	15 <sup>3</sup>	34 <sup>2</sup>				
0-60 (HiZ Port)	0	6	12	18	37 <sup>2</sup>					

LNA GR (dB) by Band and LNAstate for RSPduo:

Frequency (MHz)	LNAstate									
	0	1	2	3	4	5	6	7	8	9
0-60 (50 Ω Ports)	0	6	12	18	37	42	61 <sup>2</sup>			
60-420	0	6	12	18	20	26	32	38	57	62
420-1000	0	7	13	19	20	27	33	39	45	64 <sup>2</sup>
1000-2000	0	6	12	20	26	32	38	43	62 <sup>2</sup>	
0-60 (HiZ Port)	0	6	12	18	37 <sup>2</sup>					

<sup>1</sup> Mixer GR only

<sup>2</sup> Includes LNA GR plus mixer GR

<sup>3</sup> In LNAstate 3, external LNA GR only, in LNAstate 4, external plus internal LNA GR
